N-[2-(Diphenylphosphanyl)benzylidene]-4-methylaniline

Oleh : Abdul Malik

Abstract

The title compound, C₂₆H₂₂NP, is a Schiff base derived from triphenylphosphine with a 4-methylphenylamine group attached to one of the benzene rings of the phosphine in the o-position. The azomethine C N bond length is 1.259 (3) Å and the dihedral angle between the benzene ring and its 4-methylphenylamine substituent is 40.02 (2) Å. The geometry at the P atom is approximately tetrahedral.

Key words: N-[2-(Diphenylphosphanyl)benzylidene]-4-methylaniline, Structure

Comment

Schiff bases derived from phosphines are relatively scarce. An example is N-benzylidene-3-(diphenylphosphino)-1-propanamine (Xie et al., 2001), a diphenylphosphine system with an N-benzylidene-1propanamine Schiff base group bound to the P atom by the terminal carbon of the propylamine fragment. The presence of both P and N atoms as soft and hard electron donors, respectively, is attractive from the point of view of heterometallic complexation, but also as potential catalysts, providing active sites for an incoming substrate (Elliott et al., 1999).

The title compound, (I), is a triphenylphosphine derivative in which one of the benzene rings is substituted in the ortho position with a 4methylphenylamine group (Fig. 1). Bond lengths and angles in the molecule are in normal ranges (Allen et al., 1987), with an azomethine C7 N1 bond length of 1.259 (3) Å and an approximately tetrahedral geometry around P1 (Table 1).

The methylene-p-toluidine fragment, C1–C6/N1/C7, is planar, with a maximum deviation of 0.040 (4) Å for atom N1. Its least-squares plane is at an angle of 40.0 (2)_ with respect to benzene ring C9–C10 to which it is bound. This benzene ring also makes dihedral angles of 85.98 (18) and 87.1 (2)_ with benzene rings C15–C20 and C21– C26, respectively. There is one weak intramolecular hydrogen bond, C8–H8A^{...}P1 (Table 2), which contributes to the stability of the molecule.

Experimental

2-(Diphenylphosphino)benzaldehyde (0.939 g, 3.23 mmol) and ptoluidine (0.398 g, 3.72 mmol) were dissolved in 100 ml of an MeOH– CH₂Cl₂ (3:1 v/v) mixture and stirred under N₂ for 4 h. After standing overnight at room

temperature, the solution was concentrated to a small volume (ca 5 ml) and kept at 253 K for 24 h. A yellow crystalline solid, (I) (yield 75%), was obtained and washed with cold ethanol. Crystals suitable for X-ray analysis were obtained by recrystallization from ethanol (m.p. 394.2–395.4 K). Analysis calculated: C 82.3, H 5.84, N 3.69%; found: C
